Les complications cardiovasculaires III

La prévention primaire

- Style de vie:
  - IMC
  - Alimentation (régime méditerranéen)
  - Alcool
  - Exercice physique

Prévention primaire

Les mesures de style de vie

- Arrêt du tabagisme et éviter le tabagisme passif
- Correction des habitudes alimentaires : au niveau des lipides, graisses saturées, cholestérol, acides gras polyinsaturés (d'origine végétale et marine), fruits frais et légumes, nombre de calories, sel et alcool: cf régime méditerranéen
- Activité physique régulière

Indice de masse corporelle

Body-mass index and cause-specific mortality in 900 000 adults: collaborative analyses of 57 prospective studies

*Prospective Studies Collaboration**

Lancet 2009; 373: 1083–96

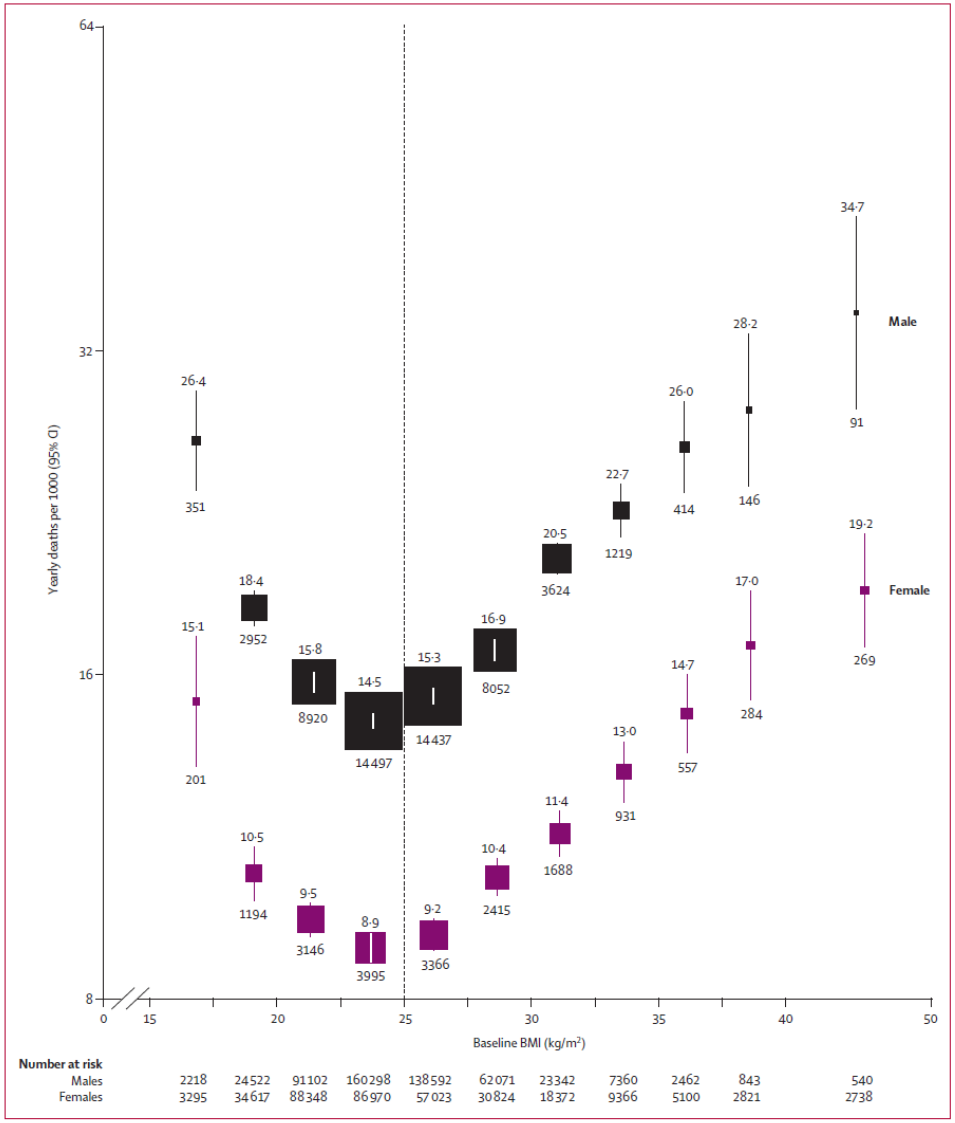

Figure 2: **All-cause mortality versus BMI for each sex in the range 15–50 kg/m² (excluding the first 5 years of follow-up)**
Relative risks at ages 35–89 years, adjusted for age at risk, smoking, and study, were multiplied by a common factor (ie, floated) to make the weighted average match the PSC mortality rate at ages 35–79 years. Floated mortality rates shown above each square and numbers of deaths below. Area of square is inversely proportional to the variance of the log risk. Boundaries of BMI groups are indicated by tick marks. 95% CIs for floated rates reflect uncertainty in the log risk for each single rate. Dotted vertical line indicates 25 kg/m² (boundary between upper and lower BMI ranges in this report).

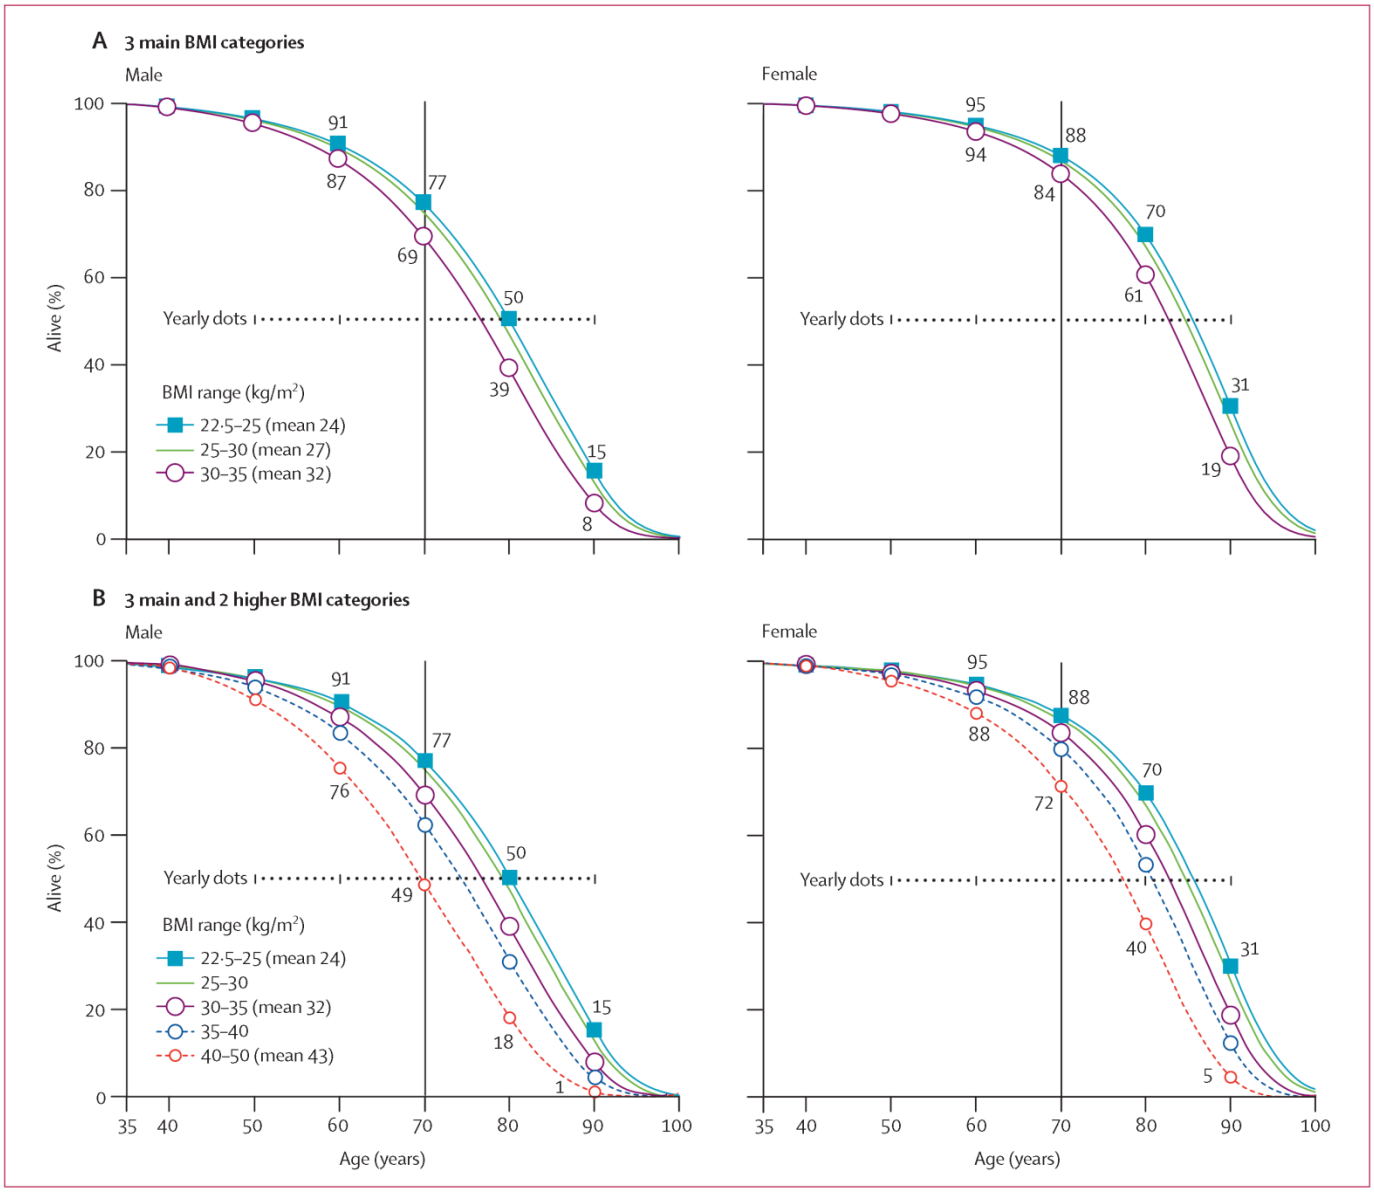

Figure 7: **BMI versus lifespan in western Europe, year 2000**

Separate and combined associations of body-mass index and abdominal adiposity with cardiovascular disease: collaborative analysis of 58 prospective studies

The Emerging Risk Factors Collaboration*

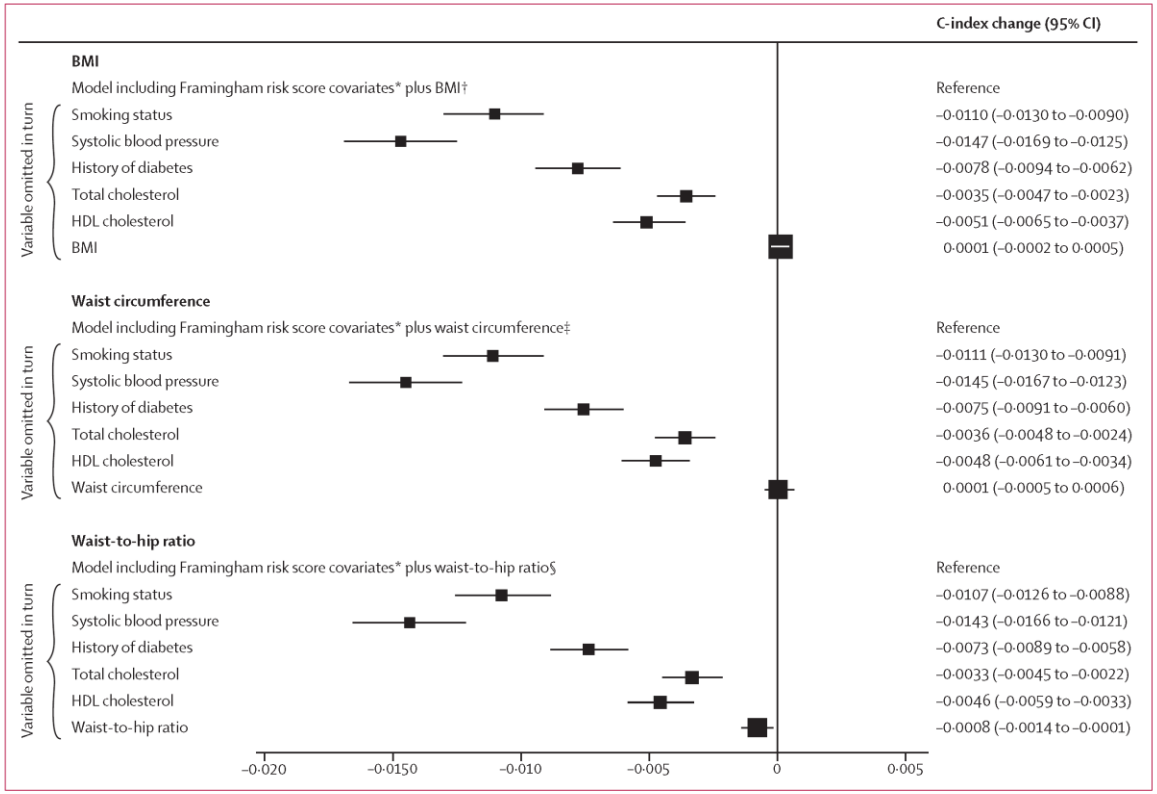

Figure 6: **Changes in C-index for cardiovascular disease risk prediction from omission of individual risk factors from a full model containing Framingham risk score covariates plus BMI, waist circumference, or waist-to-hip ratio**

Analyses were based on 144 795 participants (8347 cardiovascular events) in 39 studies. Analyses were restricted to participants with BMI of 20 kg/m² or higher. BMI=body-mass index. *Framingham risk score covariates include age, smoking status, systolic blood pressure, history of diabetes, and total and HDL cholesterol, and model was stratified by sex. †Reference C-index of 0·7324 (95% CI 0·7272 to 0·7375). ‡Reference C-index of 0·7324 (95% CI 0·7273 to 0·7376). §Reference C-index of 0·7333 (95% CI 0·7281 to 0·7384).

Régime méditerranéen

- Consommation de céréales accrue : pain, pâtes, riz, semoule…
- Consommation accrue de pommes de terre, fruits et légumes dont légumineuses (haricots, fèves…)
- Consommation accrue de noix, noisettes, amandes Huile d'olive : principale source de graisses
- Consommation modérée de poissons et volailles et de yaourts et fromages
- Réduction de la consommation en viande rouge
- Vin en quantité modérée aux repas

THE LANCET

Mediterranean alpha-linolenic acid-rich diet in secondary prevention of coronary heart disease

Michel de Lorgeril, Serge Renaud, Nicole Mamelle, Patricia Salen, Jean-Louis Martin, Isabelle Monjaud, Jeannine Guidollet, Paul Touboul, Jacques Delaye

Lancet 1994; **343:** 1454–59

Mediterranean Diet, Traditional Risk Factors, and the Rate of Cardiovascular Complications After Myocardial Infarction

Final Report of the Lyon Diet Heart Study

Michel de Lorgeril, MD; Patricia Salen, BSc; Jean-Louis Martin, PhD; Isabelle Monjaud, BSc; Jacques Delaye, MD; Nicole Mamelle, PhD

(*Circulation.* 1999;99:779-785.)

régime dit méditerranéen

- augmentation de la consommation de pain, de légumes verts, de légumes à base de racines, de fruits et de poissons
- diminution de la consommation de viande et remplacement du bœuf, de l'agneau et du porc par des volailles
- utilisation de l'huile d'olive ou de colza pour les salades et la cuisine
- remplacement du beurre et de la crème de lait par une margarine à base de colza
- quantité modérée de vin autorisée (mais non conseillée) au cours des repas

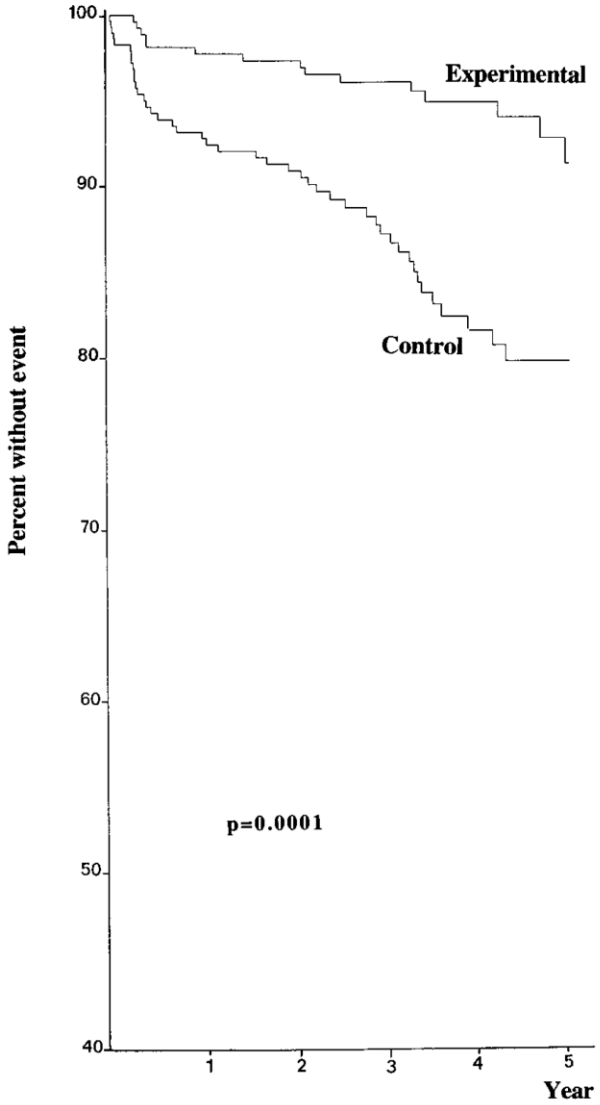

Figure 1. Cumulative survival without nonfatal myocardial infarction (CO 1) among experimental (Mediterranean group) patients and control subjects.

TABLE 1. End Points in the 2 Groups and Risk Ratios for the 3 Composite Outcomes Calculated With the Cox Proportional-Hazards Model

	Control		Experimental			
	Number	Rate*	Number	Rate	Risk Ratio† (95% CI)	*P*
Major primary end points						
Cardiac deaths	19	1.37	6	0.41	0.35 (0.15–0.83)	0.01

DOI: 10.1056/NEJMoa1800389

Table 1. Summary of Dietary Recommendations to Participants in the Mediterranean-Diet Groups and the Control-Diet Group.

Food	Goal
Mediterranean diet	
Recommended	
Olive oil*	≥4 tbsp/day
Tree nuts and peanuts†	≥3 servings/wk
Fresh fruits	≥3 servings/day
Vegetables	≥2 servings/day
Fish (especially fatty fish), seafood	≥3 servings/wk
Legumes	≥3 servings/wk
Sofrito‡	≥2 servings/wk
White meat	Instead of red meat
Wine with meals (optionally, only for habitual drinkers)	≥7 glasses/wk
Discouraged	
Soda drinks	<1 drink/day
Commercial bakery goods, sweets, and pastries§	<2 servings/wk
Spread fats	<1 serving/day
Red and processed meats	<1 serving/day
Low-fat diet (control)¶	
Recommended	
Low-fat dairy products	≥3 servings/day
Bread, potatoes, pasta, rice	≥3 servings/day
Fresh fruits	≥3 servings/day
Vegetables	≥2 servings/day
Lean fish and seafood	≥3 servings/wk
Discouraged	
Vegetable oils (including olive oil)	≤2 tbsp/day
Commercial bakery goods, sweets, and pastries§	≤1 serving/wk
Nuts and fried snacks	≤1 serving/wk
Red and processed fatty meats	≤1 serving/wk
Visible fat in meats and soups‖	Always remove
Fatty fish, seafood canned in oil	≤1 serving/wk
Spread fats	≤1 serving/wk
Sofrito‡	≤2 servings/wk

Table 2. Baseline Characteristics of the Participants, According to Intervention Group.*

Lancet 2022; 399: 1876–85
Published Online

Summary

Background Mediterranean and low-fat diets are effective in the primary prevention of cardiovascular disease. We did a long-term randomised trial to compare the effects of these two diets in secondary prevention of cardiovascular disease.

Funding Fundacion Patrimonio Comunal Olivarero; Fundacion Centro para la Excelencia en Investigacion sobre Aceite de Oliva y Salud; local, regional, and national Spanish Governments; European Union.

	Mediterranean diet group	Low-fat diet group
Oil (including the oil used for cooking, dressing, and meals consumed outside the home)	Four or more tablespoons of extra virgin olive oil per day (40–60 g per day)	Less than two tablespoons of vegetable oils (eg, sunflower oil or regular olive oil) per day (20–30 g per day)
Fruit	Three or more servings of fresh fruit and natural fruit juices per day	Three or more servings of fresh, frozen, canned, or dried fruits per day
Vegetables	Two or more servings per day (at least one serving raw or as a salad)	Two or more servings per day (fresh, frozen, or canned, without added fat, sauce, or salt)
Grains and potatoes	Six servings of preferably whole grains per day	Six to 11 servings of grains (preferably whole grains), potatoes, and legumes per day
Legumes	Three or more servings per week	Six to 11 servings of grains (preferably whole grains), potatoes, and legumes per day
Dairy	Two servings per day	Two to three servings of low-fat or fat-free dairy products per day
Tree nuts	Three or more servings of raw, non-roasted, or fried nuts per week	Occasional consumption (one serving or less) of raw, non-roasted, or fried nuts per week
Fish and seafood	Three or more servings of especially fatty fish per week	Choose lean fish; limit fatty fish and seafood canned in oil to one serving or fewer per week
White meat	Consume white meat (eg, chicken, turkey, or rabbit) instead of red meat; remove skin and visible fat	Choose skinless poultry and lean cuts (eg, loin or round)
Red or processed meats	Less than one serving per week	One serving or fewer per week
Eggs	Two to four units per week	Two or fewer egg yolks per week
Commercial bakery products, sweets, and pastries	One serving or fewer per week	One serving or fewer per week
Butter and margarine	Not allowed	One serving or fewer per week
Wine	Optional consumption, only in case of a habitual wine drinker (one glass per day for women and two glasses per day for men)	Not allowed
Sweet or carbonated beverages	Less than one drink per day	Less than one drink per day
Culinary techniques	Use of sofrito (a homemade sauce with garlic, onion, aromatic herbs, and tomato slow cooked in olive oil) two or more times a week	Use low-fat cooking methods (eg, broiling, grilling, roasting, baking, microwaving, and poaching); avoid frying and use of sofrito; remove the visible fat before cooking

Table 1: **Summary of dietary recommendations to the patients in the two intervention groups of the CORDIOPREV study**

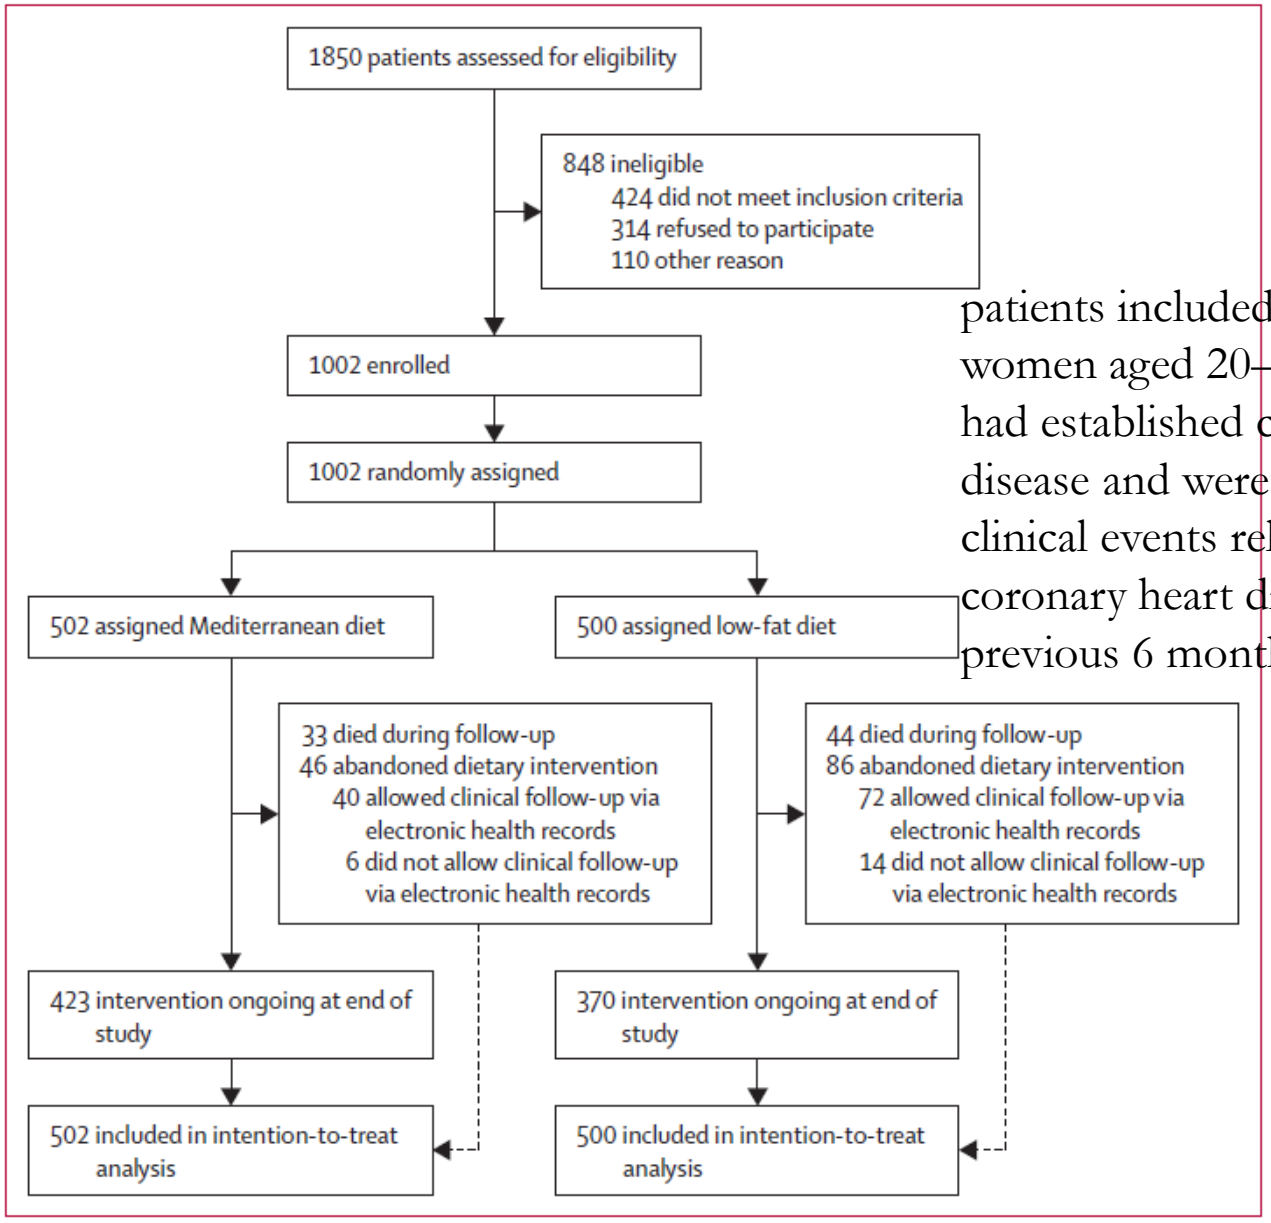

Figure 1: **Trial profile**

patients included men and women aged 20–75 years who had established coronary heart disease and were free of clinical events related to coronary heart disease in the previous 6 months

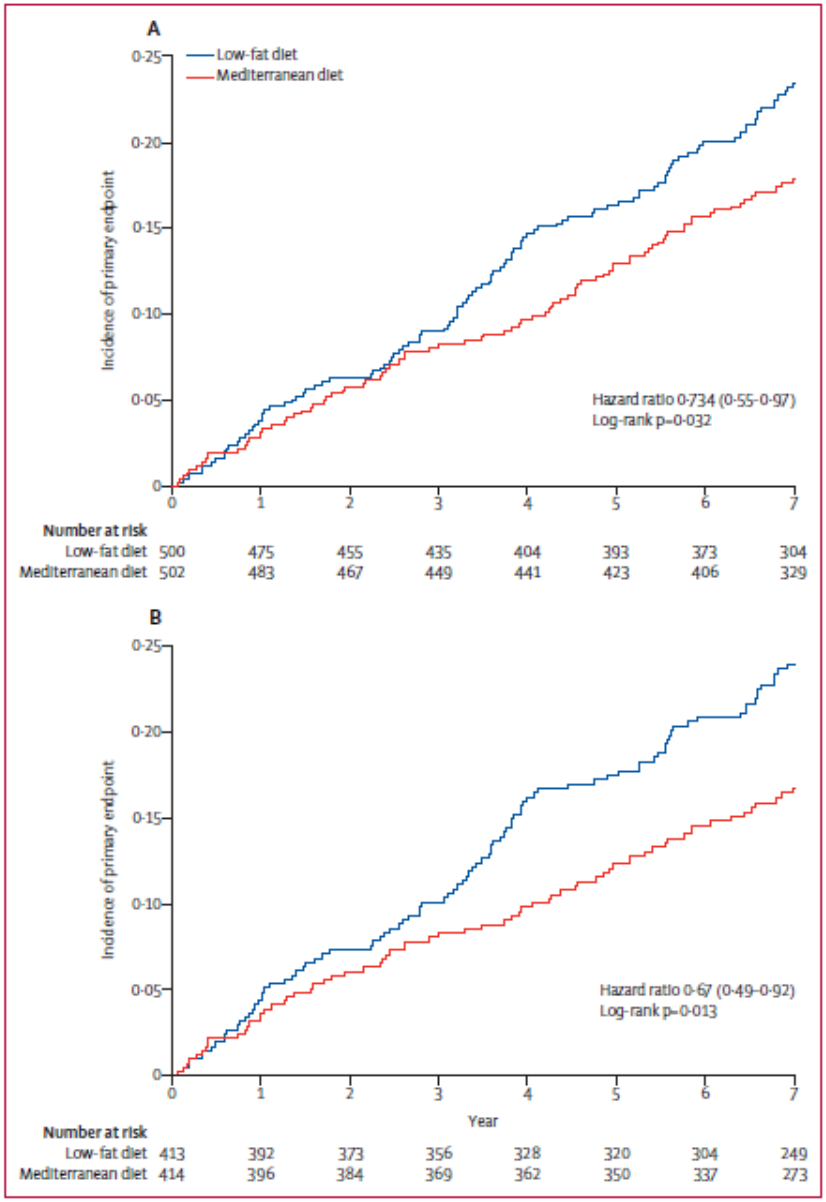

***Figure 2*: Kaplan-Meier estimates of the incidence of the composite primary endpoints of myocardial infarction, revascularisation, ischaemic stroke, documented peripheral artery disease, and cardiovascular death events**
(A) Total study population of the CORDIOPREV study. (B) Male population (827 [82·5%] of 1002) of the CORDIOPREV study. Hazard ratios and confidence intervals are from the multivariable-adjusted Cox model (adjusted for diet, age, family history of coronary disease, and smoking).

	Mediterranean diet (n=502)	Low-fat diet (n=500)	p value
Unadjusted	0·745 (0·563–0·986)	1 (ref)	0·040
Multivariable adjusted for age and sex	0·738 (0·558–0·978)	1 (ref)	0·034
Multivariable adjusted for age, sex, family history of early coronary heart disease, and smoking	0·734 (0·555–0·974)	1 (ref)	0·032
Multivariable adjusted for age, sex, family history of early cardiovascular disease, smoking, BMI, LDL cholesterol, diabetes, and hypertension	0·753 (0·568–0·998)	1 (ref)	0·049
Multivariable adjusted for age, sex, hypertension, LDL cholesterol (<100 mg/dL), BMI, smoking, statins (intensity), and diabetes	0·747 (0·564–0·990)	1 (ref)	0·042
Multivariable adjusted for age, sex, family history of early coronary heart disease, smoking, and pharmacological treatments* at baseline	0·748 (0·562–0·997)	1 (ref)	0·048
Multivariable adjusted for age, sex, hypertension, LDL cholesterol (<100 mg/dL), BMI, smoking, statins (intensity), diabetes, and changes in weight and physical activity during follow-up	0·740 (0·558–0·982)	1 (ref)	0·035
Multivariable adjusted for all covariates used in the different models and randomisation order	0·719 (0·541–0·957)	1 (ref)	0·024

Data are hazard ratio (95% CI) or p value. All p values were calculated with Cox proportional-hazards models. The primary endpoint was a composite of myocardial infarction, revascularisation, ischaemic stroke, documented peripheral artery disease, and cardiovascular death events. BMI=body-mass index. *Statins, other lipid-lowering drugs, angiotensin-converting enzyme inhibitors, angiotensin II receptor blockers, β-blockers, calcium antagonists, diuretics, insulin, oral antidiabetics, antiplatelets, and anticoagulants.

Table 3: **Hazard ratios for the main outcome of the Mediterranean diet and low-fat diet groups**

Consommation d'alcool

Cite this as: *BMJ* 2011;342:d671
doi:10.1136/bmj.d671

1 verre standard = 10 g d'alcool

- 7 cl d'apéritif à 18°
- 2,5 cl de digestif à 45°
- 10 cl de champagne à 12°
- 25 cl de cidre "sec" à 5°
- 2,5 cl de whisky à 45°
- 25 cl de bière à 5°
- 2,5 cl de pastis à 45°
- 10 cl de vin rouge ou blanc à 12°

25 cl de bière forte correspond à 2 verres standard et une bouteille de vin à 8 verres standard

*Adjustment for confounding factors was dichotomised as weak (<median value) or strong (≥median value). Cut points: ≥5 for coronary heart disease and stroke mortality, ≥6 for cardiovascular disease mortality and incident coronary heart disease, ≥7 for incident stroke.
†Total follow-up time was dichotomised as short (<median value) or long (≥median value). Cut points: ≥9 for incident coronary heart disease, ≥10 for cardiovascular disease mortality, ≥12 for coronary heart disease mortality and incident stroke, ≥14 for stroke mortality.

Alcohol Drinking and Cardiovascular Risk in a Population With High Mean Alcohol Consumption

Maryline Foerster, MD[a], Pedro Marques-Vidal, MD, PhD[a,b], Gerhard Gmel, PhD[d,e], Jean-Bernard Daeppen, MD[d], Jacques Cornuz, MD, MPH[c], Daniel Hayoz, MD[f], Alain Pécoud, MD[c], Vincent Mooser, MD[h], Gérard Waeber, MD[g], Peter Vollenweider, MD[g], Fred Paccaud, MD[a], and Nicolas Rodondi, MD, MAS[c,*]

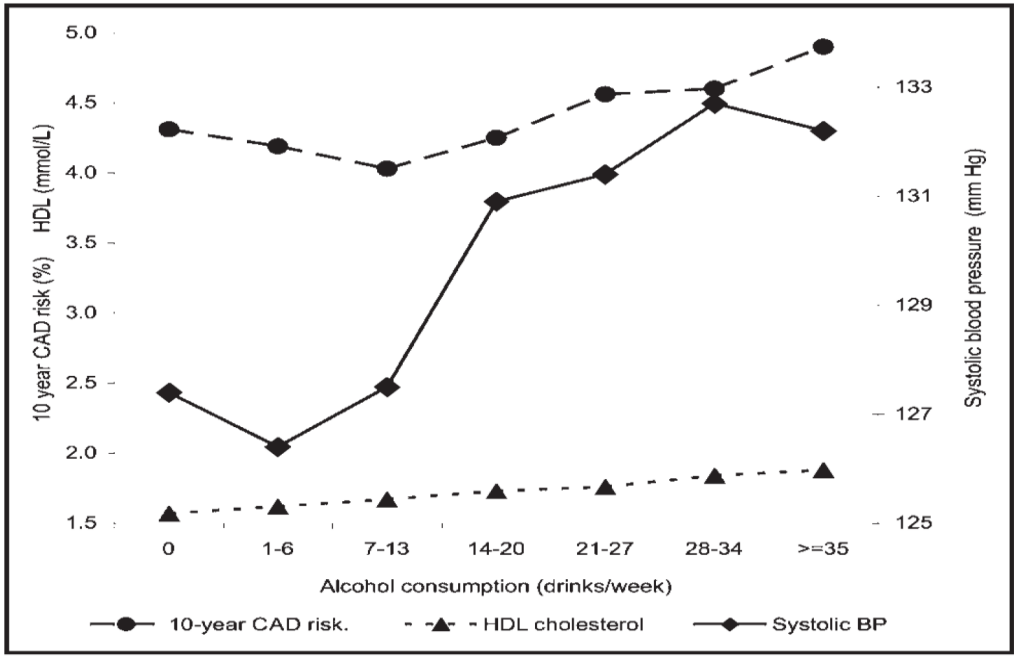

Figure 1. Association between alcohol consumption, cardiovascular risk factors, and 10-year CAD risk. HDL cholesterol, systolic blood pressure (BP), and 10-year CAD risk according to last week alcohol consumption. Values are adjusted for age, gender, education, units of weekly physical activity, tobacco use, body mass index, statins (for HDL cholesterol), and antihypertensive medications (for systolic BP). Alcohol consumption was associated with increased HDL cholesterol (p for trend <0.001), systolic BP (p for trend <0.001), and 10-year CAD risk (p for trend $= 0.03$).

Conclusions

- À l'aide de données sur l'alcool enregistrées de manière prospective, cette étude a montré comment l'instabilité des comportements de consommation au fil du temps est associée au risque de coronaropathie.
- Outre les personnes qui s'abstiennent de boire (à long terme ou plus récemment), les personnes dont la consommation d'alcool n'est pas modérée de façon consistante ont un risque plus élevé de contracter une coronaropathie.
- Cette découverte suggère que les politiques et les interventions encourageant spécifiquement la cohérence dans le respect des directives de consommation à faible risque pourraient avoir des effets bénéfiques sur la santé publique en réduisant le fardeau de la coronaropathie pour la population.
- L'absence d'effet chez les grands buveurs doit être interprétée avec prudence, compte tenu des risques plus généraux connus pour la santé liés à une telle consommation.

ABSTRACT

OBJECTIVE

To investigate the association between alcohol consumption (at baseline and over lifetime) and non-fatal and fatal coronary heart disease (CHD) and stroke.

DESIGN

Multicentre case-cohort study.

RESULTS

There were 9307 non-fatal CHD events, 1699 fatal CHD, 5855 non-fatal stroke, and 733 fatal stroke. Baseline alcohol intake was inversely associated with non-fatal CHD, with a hazard ratio of 0.94 (95% confidence interval 0.92 to 0.96) per 12 g/day higher intake. There was a J shaped association between baseline alcohol intake and risk of fatal CHD. The

Conclusions

- « La consommation d'alcool est inversement associée au risque de cardiopathie non mortelle, mais positivement au risque d'accident vasculaire cérébral, soulignant les associations opposées de la consommation d'alcool avec différents types de MCV.
- Compte tenu des connaissances antérieures sur l'association positive de l'alcool à la mortalité toutes causes confondues et au risque de cancer, nos résultats renforcent les politiques visant à réduire la consommation d'alcool ».

Effet protecteur à petites doses

Association Between Daily Alcohol Intake and Risk of All-Cause Mortality
A Systematic Review and Meta-analyses

Jinhui Zhao, PhD; Tim Stockwell, PhD; Tim Naimi, MD; Sam Churchill, MSc; James Clay, MSc; Adam Sherk, PhD

107 études sur la consommation d'alcool et la mortalité toutes causes confondues publiées de 1980 à juillet 2021.

JAMA Network Open. 2023;6(3):e236185. doi:10.1001/jamanetworkopen.2023.6185

- Modèles ajustés pour les effets de confusion potentiels de la variation d'échantillonnage, du biais des anciens buveurs et d'autres critères de qualité prédéfinis : aucune réduction significative du risque de mortalité toutes causes confondues chez les occasionnels (> 0 à < 1,3 g d'éthanol par jour ; risque relatif [RR], 0,96 ; IC à 95 %, 0,86-1,06 ; P = 0,41) ou buveurs à faible volume (1,3-24,0 g par jour ; RR, 0,93 ; P = 0,07) par rapport aux non-buveurs à vie.
- Modèle entièrement ajusté : augmentation non significative du risque de mortalité toutes causes confondues chez les buveurs qui buvaient de 25 à 44 g par jour (RR, 1,05 ; P = 0,28) et risque significativement accru pour les buveurs qui buvaient de 45 à 64 et 65 ou plus grammes par jour (RR, 1,19 et 1,35 ; P < 0,001). Il y avait des risques de mortalité significativement plus élevés chez les femmes buveuses que chez les femmes non-buveuses à vie (RR, 1,22 ; P = 0,03)

Exercice physique et sédentarité

DÉFINITION DU MET

Le *metabolic equivalent task* [MET] ou équivalent métabolique est une unité qui indexe la dépense énergétique lors de la tâche considérée sur la dépense énergétique de repos. La valeur 1 MET chiffre la dépense énergétique de repos et équivaut à une consommation de l'ordre de 3,5 mL O_2/min/kg. 7,5 MET.h/sem correspond à 150 min/sem d'activité physique d'intensité modérée et 15 MET.h/sem équivaut à 300 min/sem d'activité physique d'intensité modérée.

Marcher réduit le risque coronarien

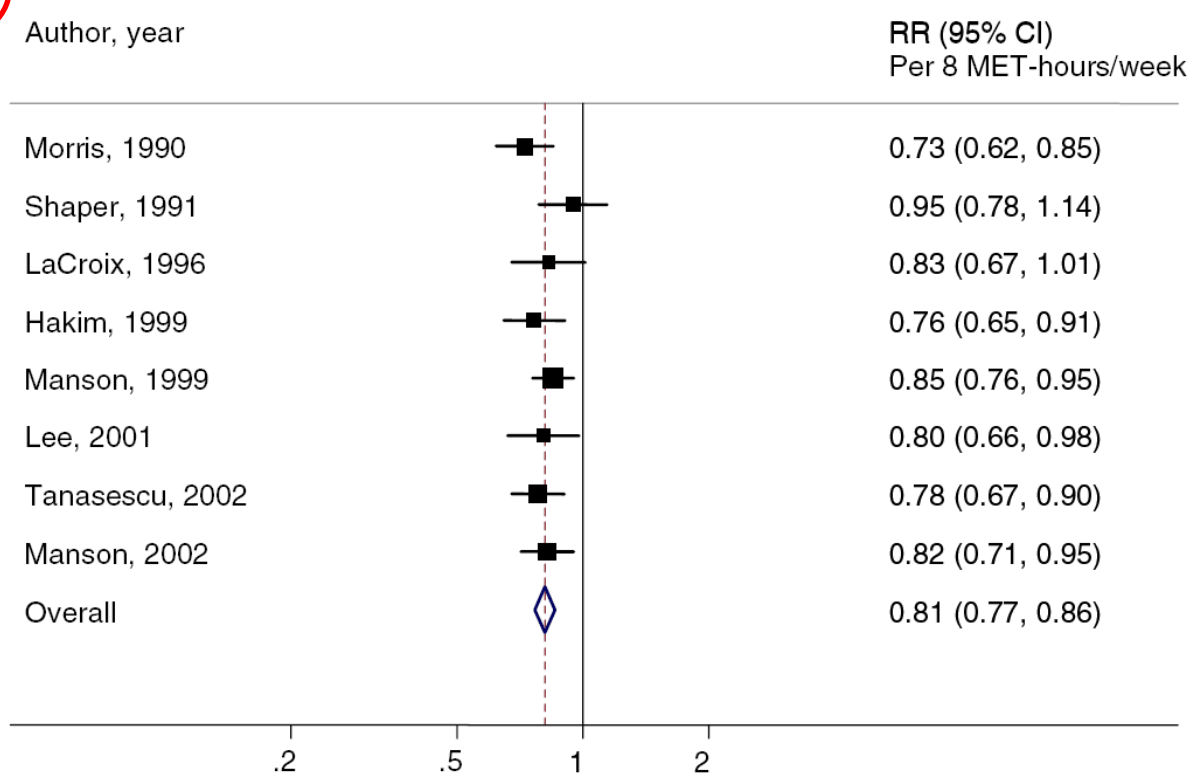
CARDIOVASCULAR DISEASE

Quantifying the dose-response of walking in reducing coronary heart disease risk: meta-analysis

Henry Zheng · Nicola Orsini · Janaki Amin · Alicja Wolk · Van Thi Thuy Nguyen · Fred Ehrlich

Fig. 6 Summary of study-specific trends (8 MET-h/week is equivalent to 30 min of normal walking a day for 5 days a week) examining the association between walking and risk of coronary heart disease. *Squares* indicate study-specific trend estimates (size of the squares reflects the inverse of the variance); *horizontal lines* indicate 95% confidence intervals; *diamond* indicates the summary relative risk estimate with 95% confidence interval. Test for heterogeneity: $Q = 5.81$, $P = 0.56$; $I^2 = 0\%$)



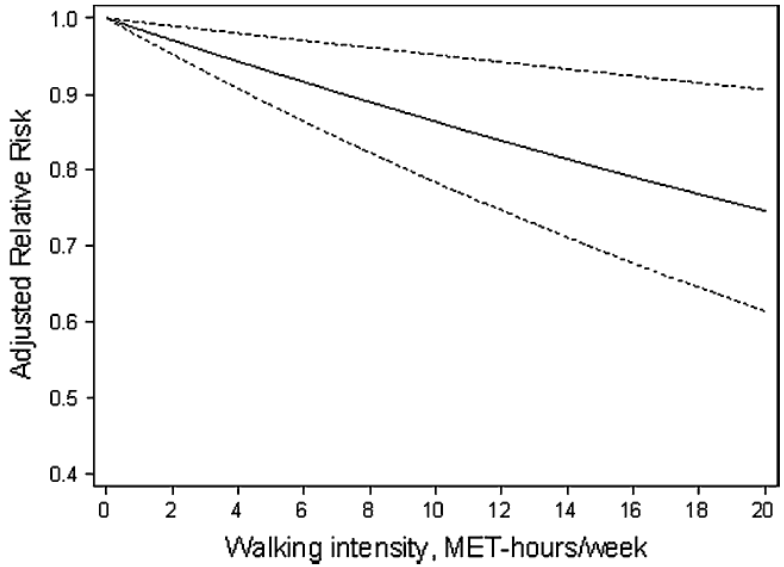


Fig. 2 Dose-response relationship between walking intensity (MET-hours/week) and risk of coronary heart disease. *Dotted lines* represent 95% confidence limits for the linear trend

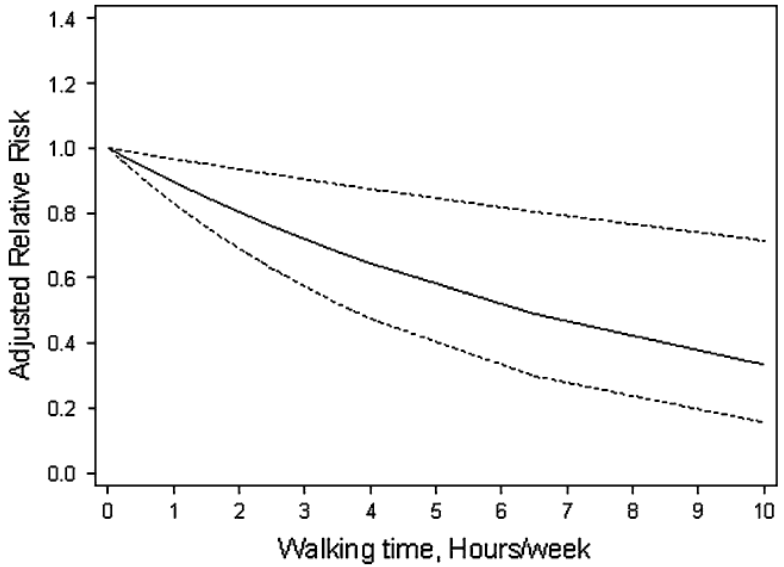

Fig. 4 Dose-response relationship between walking time (h/week) and risk of coronary heart disease. *Dotted lines* represent 95% confidence limits for the linear trend

L'effet est surtout marqué pour les niveaux les plus faibles

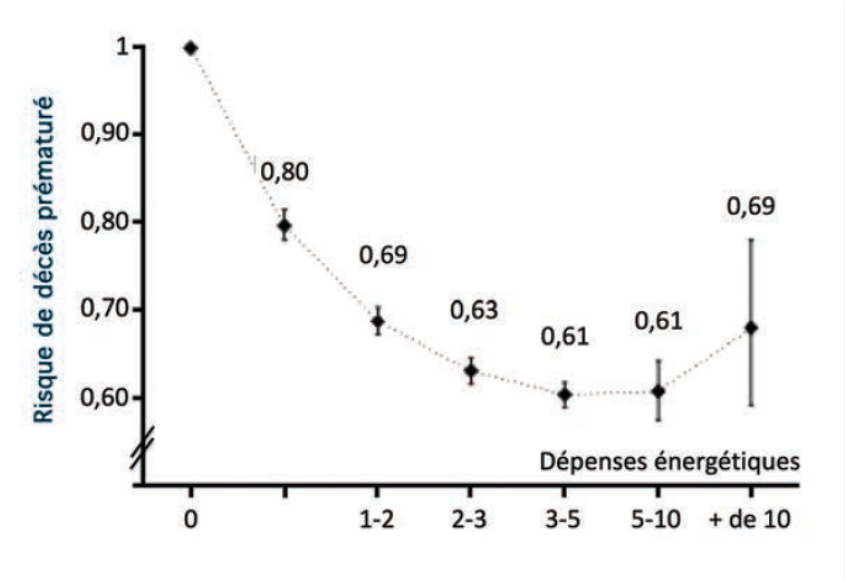

Figure 1. Relation non linéaire entre la dépense énergétique hebdomadaire liée aux activités physiques de loisir et le risque de mortalité générale (toutes causes confondues). Les dépenses énergétiques sont exprimées sous la forme de multiples des recommandations, de la valeur 0 pour les personnes qui ne les atteignent pas à des multiples de 1 pour ceux qui excèdent ces recommandations. On remarquera que le bénéfice santé le plus important est observé pour les très faibles niveaux d'activité physique. En d'autres termes, le degré de diminution du risque est beaucoup plus important pour les faibles niveaux de pratique que pour les niveaux de pratique supérieurs : passer de l'état d'inactivité totale (0) à l'atteinte des recommandations en activité physique (1) a plus d'effets relatifs que de passer de 4 à 5-6 fois les recommandations (d'après la réf. 6).
